

ELAN Avalanche System v. 2.0.0.158

Release notes

We were able to partially reproduce the situation with complete system halt due to all engines entering the HFS inaccessible error state. In order to prevent occurrence of this situation we have modified implementation of FileService at HFS that substantially increased its performance. Also, we have added an additional output of trace information on HFS for more detailed diagnostics of processing. That the latest changes should substantially increase the limit of simultaneously working engines. However, in order to more thorough analysis of the situation, we ask to provide us the trace logs from the new installation that will be produced by the new build.

HFS

- **Added:** Improved File Selection performance by synchronizing it explicitly on the type of engine
- **Added:** Extra logging of time consumed by File Selection operation

Database Administrator

- Fixed bug with launching the application on pristine machine.

Installers

Added automatically compression.

User Manual

System Monitor section updated to reflect the new error condition displaying the Hub section of the window
